Claim Rejections - 35 USC § 102

2. Claims 2-5 & 7 are rejected under 35 U.S.C. 102(b) as being anticipated by JP 8-326770. Figs. 1-3 show a tripod constant velocity joint comprising an outer joint member 1 having three axial track grooves 1a in an inner periphery and roller guide surfaces 1a formed in opposing side walls of each track groove; a tripod member 2 having three radially projecting trunnion journals 2a; and rollers 3 that rotate around respective trunnion journals through a plurality of needle rollers 6 and received in the track grooves, each roller 3 being guided on a part spherical outer peripheral surface by the roller guide surfaces. Fig. 3C shows that the contact between the roller 3 and the roller guide surfaces 1a is circular contact having a contact ratio 1.02 – 1.2, wherein the width dimension of the roller 3 is reduced to an extent that a contact ellipse produced by the roller during application of a predetermined torque does not deviate from an end surface of the roller 3. The figures show that the ratio L_s/d_o is 0.24 – 0.27. Fig. 3C shows the ends of the roller guide surface 1a with relief portion that is a smooth arc.

Response to Arguments

3. Applicant's arguments filed Oct 28, 2003 have been fully considered but they are not persuasive. In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., relief portions having a dimension that deviates towards or away from the axial end of a roller) are not

recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).
